ARCSTONE

INVENTORY+ MODULE

Gain real-time inventory overview to optimize the management of materials along your production process

The arc.ops™ **Inventory+ Module is a hardware-agnostic, standard inventory management system for incoming raw materials to production units and finished goods. The module enables the management of inventory lists and transactions through real-time tracking.**

Key Features

BOM Management

Manage your manufacturing BOM to ensure clear visibility and tracking of inventory used. Enforce approvals as BOMs are modified and updated. Held quantities are updated live as work orders are carried out, and low inventory notifications can automatically be triggered.
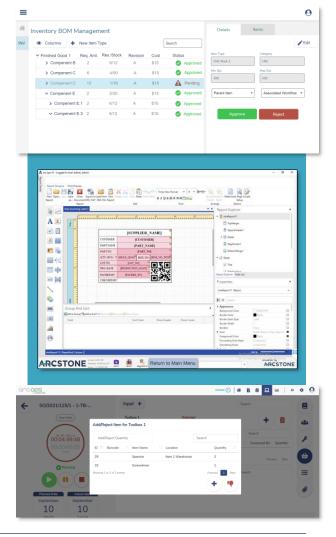

Inventory Tracking

Our inventory tracking system uses Barcodes, QR-codes or RF-IDs that are configured with custom designed labels for inventory item batch traceability throughout the production proces. Our mobile application can also be leveraged for scanning purposes.

Location & Reject Management

Inventory can be tracked through a variety of states, such as warehouse storage locations and staging areas. Rejected items can also be traced with the reasons for rejection captured to help with root cause analysis.

Why Arcstone?

Arcstone is at the forefront of helping manufacturers gain better visibility and optimization of their production processes through digitization. We are committed to continuously improving our Inventory Management solutions to give customers the tools to precisely track and manage their inventory throughout their production process.
